	City	Agglomeration	
Morphology	Politics (polis)	Land occupation (urbs)	
Inhabitant	Citizen	Urban	
Origin	Juridical (chart, rights)	Accumulation of goods, capital, activities	
Discontinuity	City/ countryside	Urban/ Rural	
Institution of reference	Religious	State	

2. Measuring urbanization

Definition & methods used for
construction the
Geopolis database

2.1. Définition

- ◆ An agglomeration is defined as a continuous built-up area
- ◆ An agglomeration is the collection of contiguous built areas with no more than **200 mètres** of space in between them.
- ◆ An agglomeration is considered urban if its total population is 10,000 or greater.

2.2. Méthodologie normale

The agglomerations make up the
Geopolis database:

Identification and calculation of the
population

Step 1

Legal limits of local units (“cities”).

It’s at this level that we collect population statistics (censuses, enumerations, civil registers)

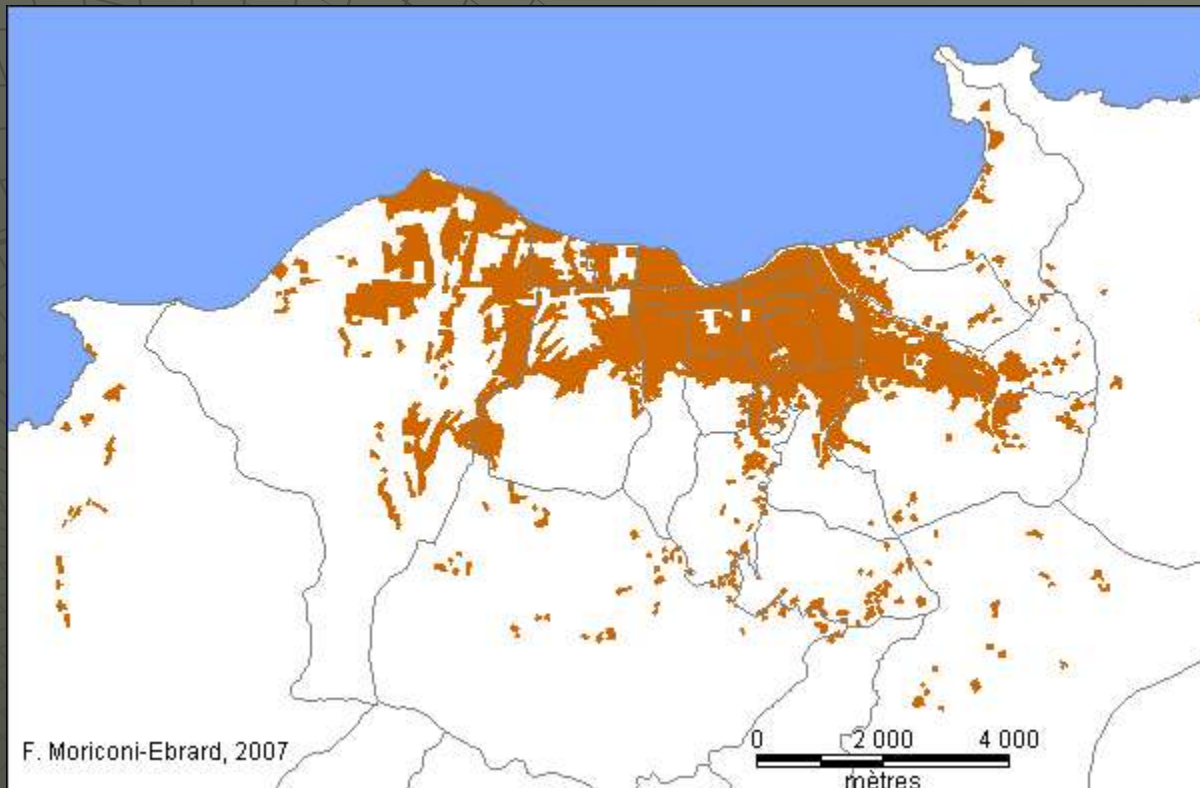

Step 2

Satellite images or topographical maps

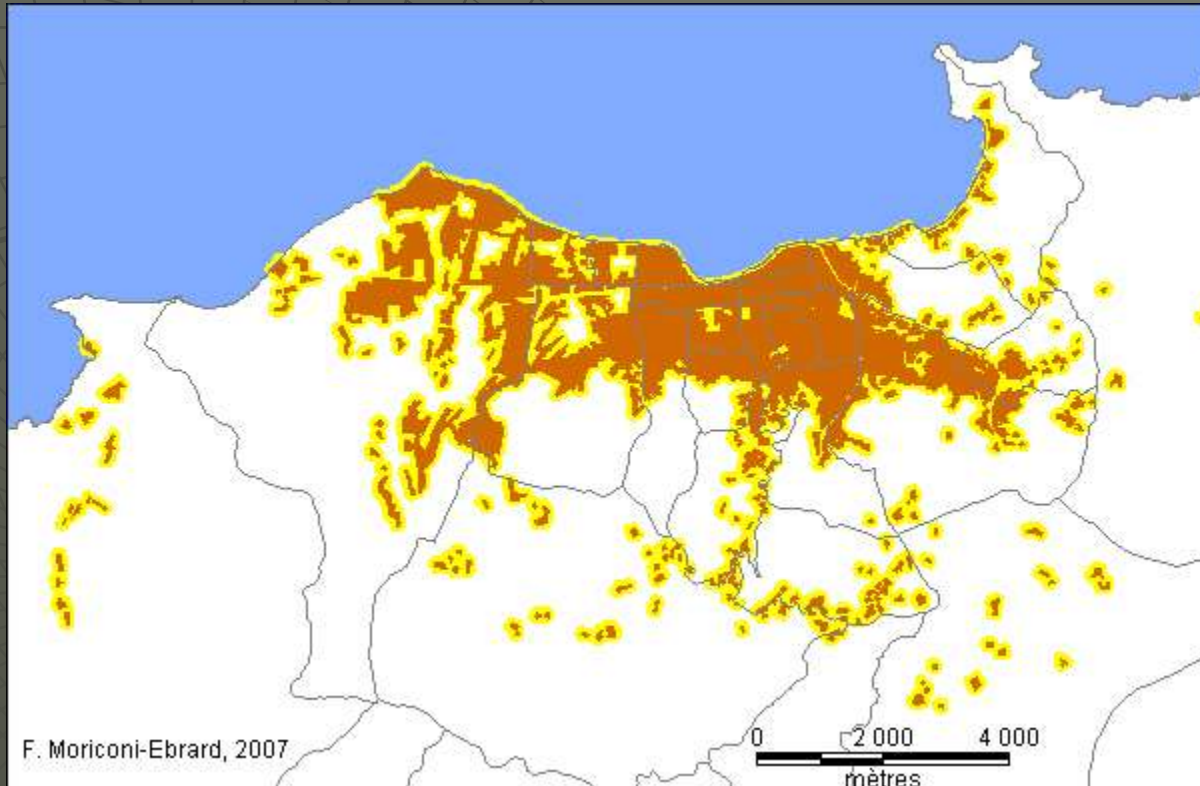

Step 3

Identification of built-up zones (“agglomerations”)

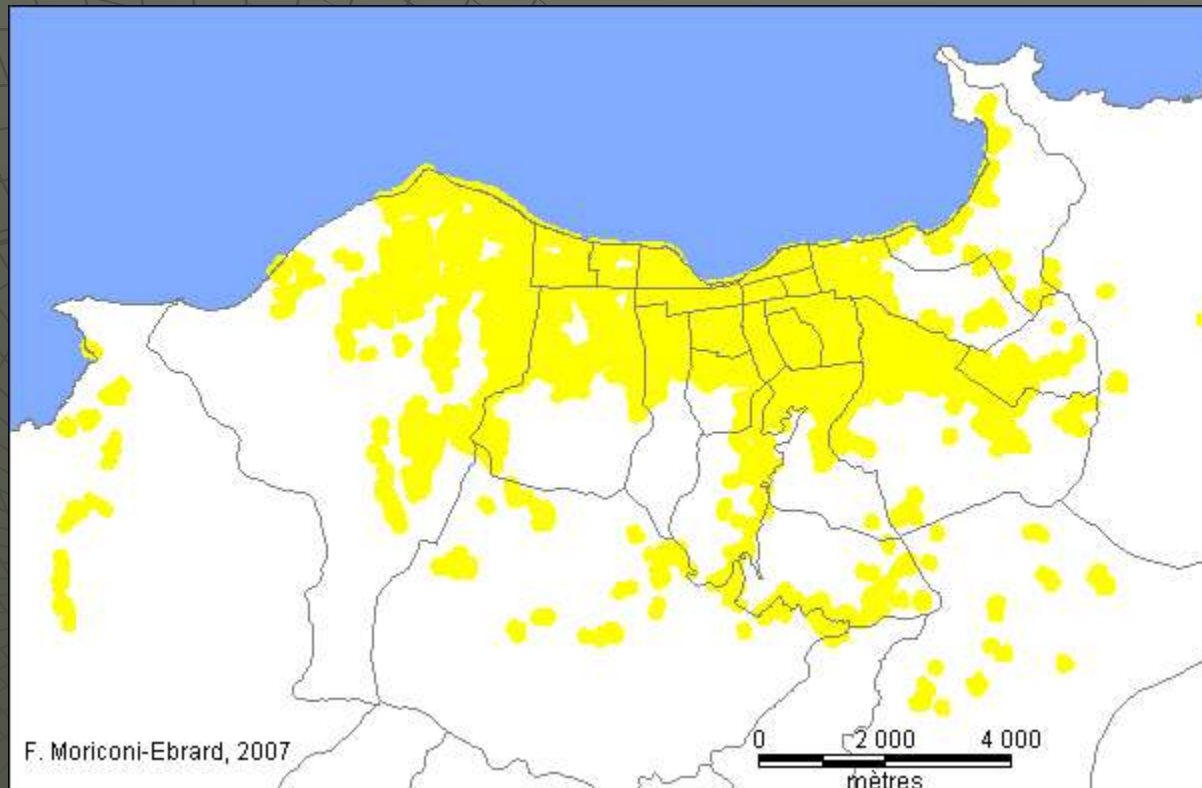

Step 4

Creation of zones within 100 meters of one another

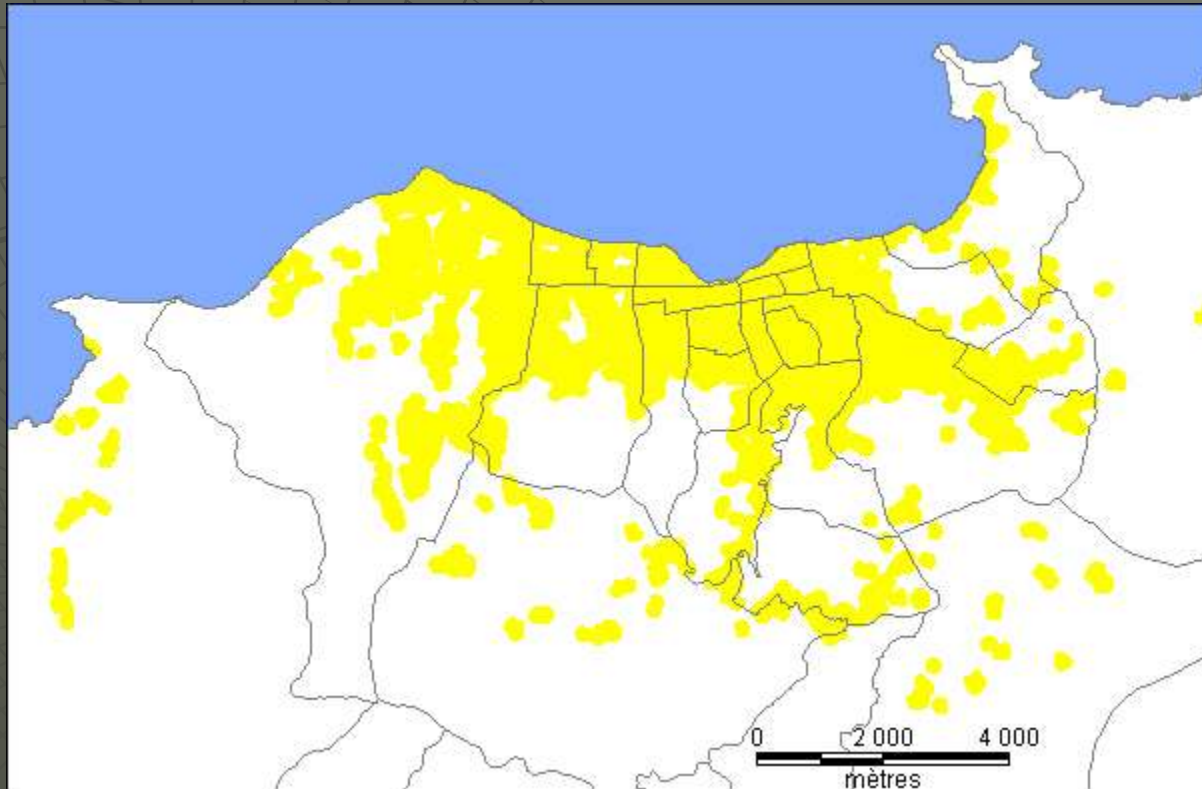

Step 5

Assembling the contiguous and overlapping zones

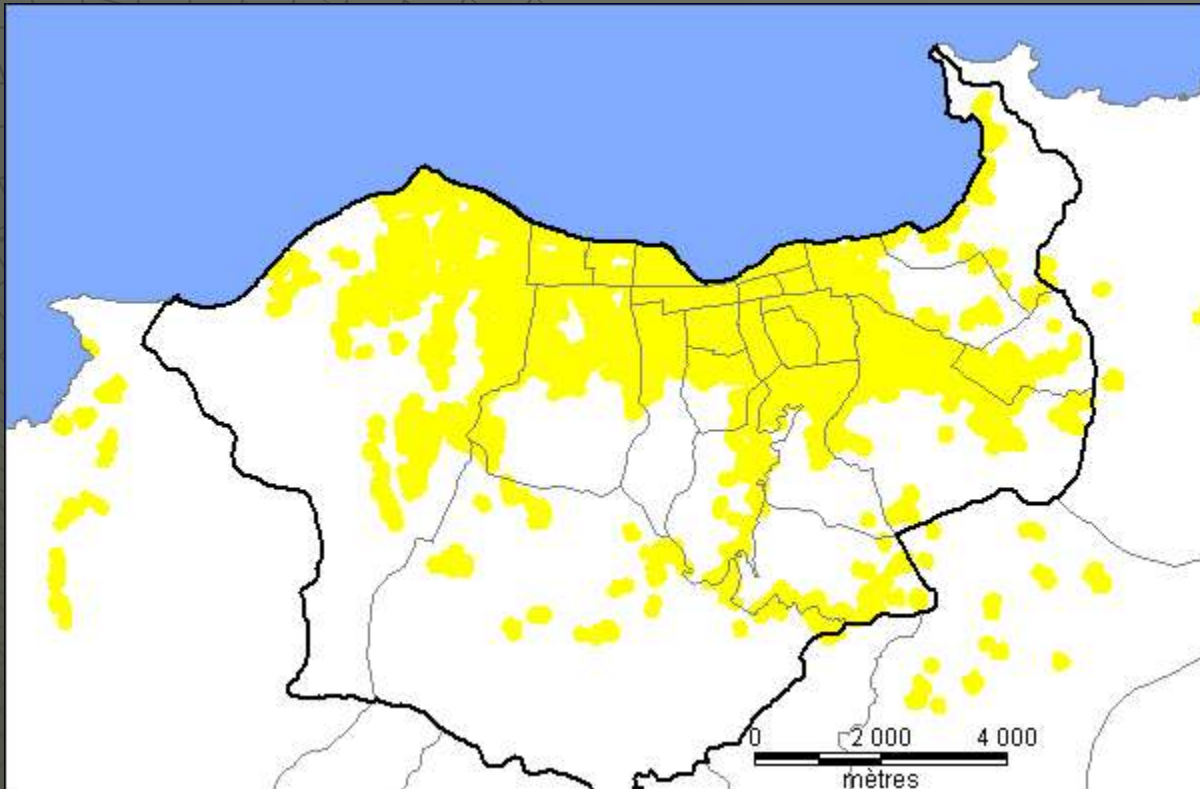

Etape 6

Ajustement des contours des agglomérations aux bords de l'écoumène

Step 7

Generalizing the contours of the agglomeration on the whole of the local units
a minimum of 50% of the population of each local must be agglomerated

2.3. Summary

- ◆ 32 000 agglomerations identified in 1990
- ◆ 60 000 in 2000 (of which 25 000 are in China et India)
- ◆ Historical Data
 - In the first version of *Geopolis*
 - . from 1950 for the whole world
 - In the current version (to be completed in 2009 : project e-*Geopolis*)
 - . from 1800 for Europe and North America
 - . from 1900 or earlier depending on the available data for the rest of the world

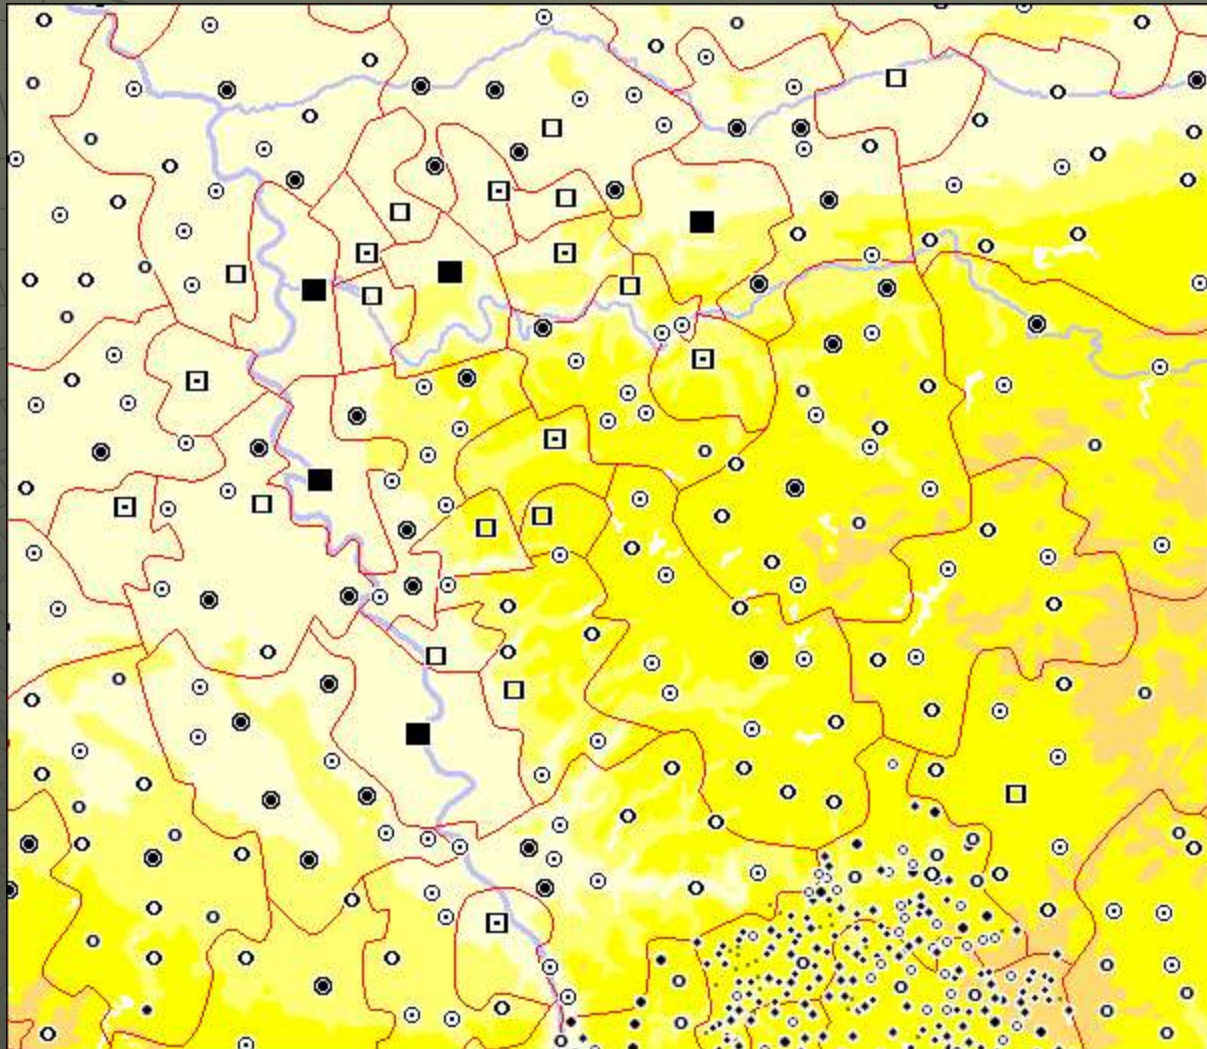

3. Quick facts

- ◆ Optimize comparisons
- ◆ Reveal non-verifiable morphologies»
- ◆ An opening-up of possibilities

◆ Germany
