

Incentives and Opportunism: From The Carrot to the Stick

C. Hilbe & K. Sigmund, Proc. R. Soc. B (2010) 277, 2427–2433

TECT Final Conference, Budapest

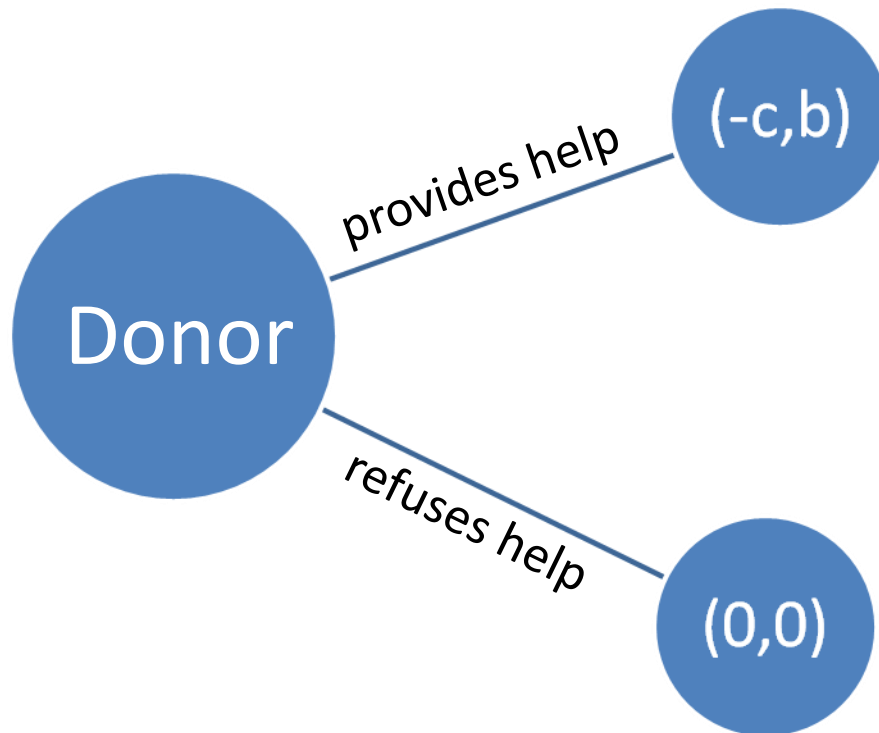

From the Carrot to the Stick

Introduction

- Helping Game

Model & Results

Discussion

Social optimum (for $b > c$):
Providing help

Individual optimum
Refusing help

Costs of helping: $-c$
Benefit of help: b

From the Carrot to the Stick

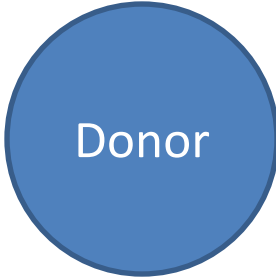

Introduction

- Dictator Game

Model & Results

Discussion

Experimental Results (Dictator Game)

		
Show-up fee	5 €	5 €
Dictator endowment	10 €	--
<hr/>		
Total payoff	15 €	5 €

Show-up fee	5 €	5 €
Dictator endowment	10 €	--
Transfer	- 3 €	3 €
<hr/>		
Total payoff	12 €	8 €

From the Carrot to the Stick

Introduction

- Dictator Game

Model & Results

Discussion

Experimental Results (Dictator Game)

- Usually, more than 50 % of the donors transfer a positive amount (1-5 €)

But:

- 97 % of the donors refuse any help, if they have earned the 10 € in a quiz (*Cherry et al., Am. Econ. Rev. 92, 2002*)
- More than 80 % of the donors are also willing to take up to 3 € from the recipient's show-up fee (*N. Bardsley, Exp. Econ. 11, 2008*)

From the Carrot to the Stick

Introduction

- Conclusion of the dictator game

Model & Results

Discussion

Conclusion

- Neither hard-nosed game theory nor pure altruism can explain the data
- Additional incentives for cooperation are needed, e.g.
 - Punishment of selfish behavior
 - Rewarding generosity

From the Carrot to the Stick

Introduction

- Examples: Punishment in animal societies

Model & Results

Discussion

Examples: Punishment in animal societies

(T.H. Clutton-Brock & G.A. Parker, Nature, 1995)

- Rhesus macaques that find sources of preferred food and do not give food calls are more likely to be the target of aggression
- Chimpanzees form supportive coalitions to gain access to resources and attack those allies that fail to support them in competitive interactions with third parties
- In *Polistes* wasps, queens are regularly aggressive to inactive workers.

Conclusion:

Punishment is 1) used to ensure cooperation and 2) is effective in doing so

From the Carrot to the Stick

Introduction

- Ultimatum Game

Model & Results

Discussion

Experimental Results (Ultimatum Game)

Show-up fee	5 €	5 €
Dictator endowment	10 €	--
Transfer	- 3 €	3 €
<hr/>		
Total payoff	12 €	8 €

From the Carrot to the Stick

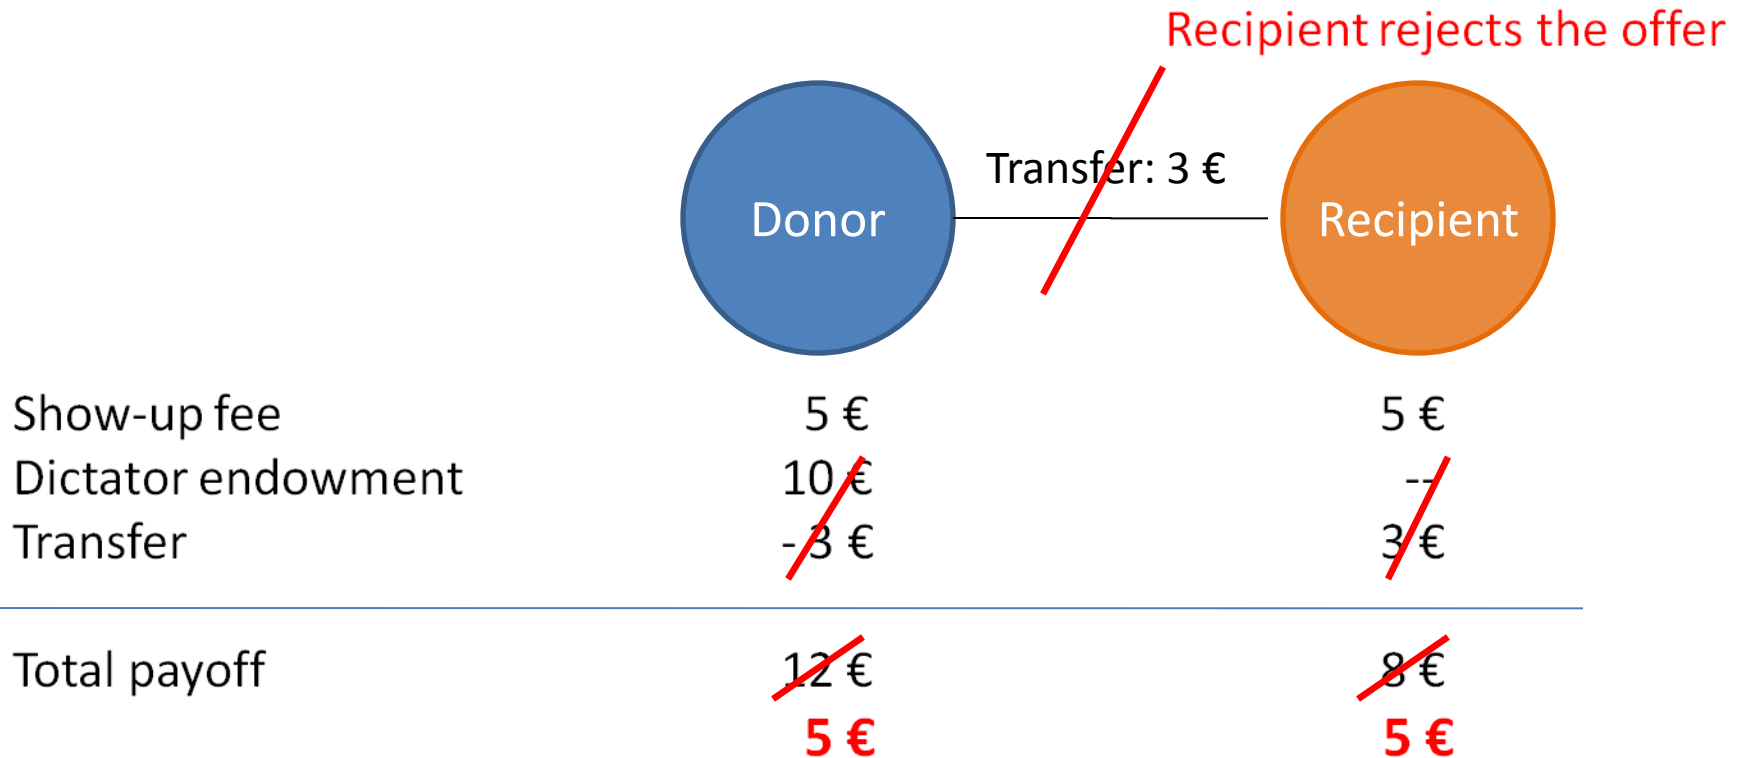

Introduction

- Ultimatum Game

Model & Results

Discussion

Experimental Results (Ultimatum Game)

From the Carrot to the Stick

Introduction

- Ultimatum Game

Model & Results

Discussion

Experimental Results (Ultimatum Game)

- Typical offers are between 3-5 €
- Lower offers are usually rejected by the recipients

Conclusions

- Individuals are willing to punish selfish behavior even if punishment is costly
- Donors anticipate this and offer higher amounts

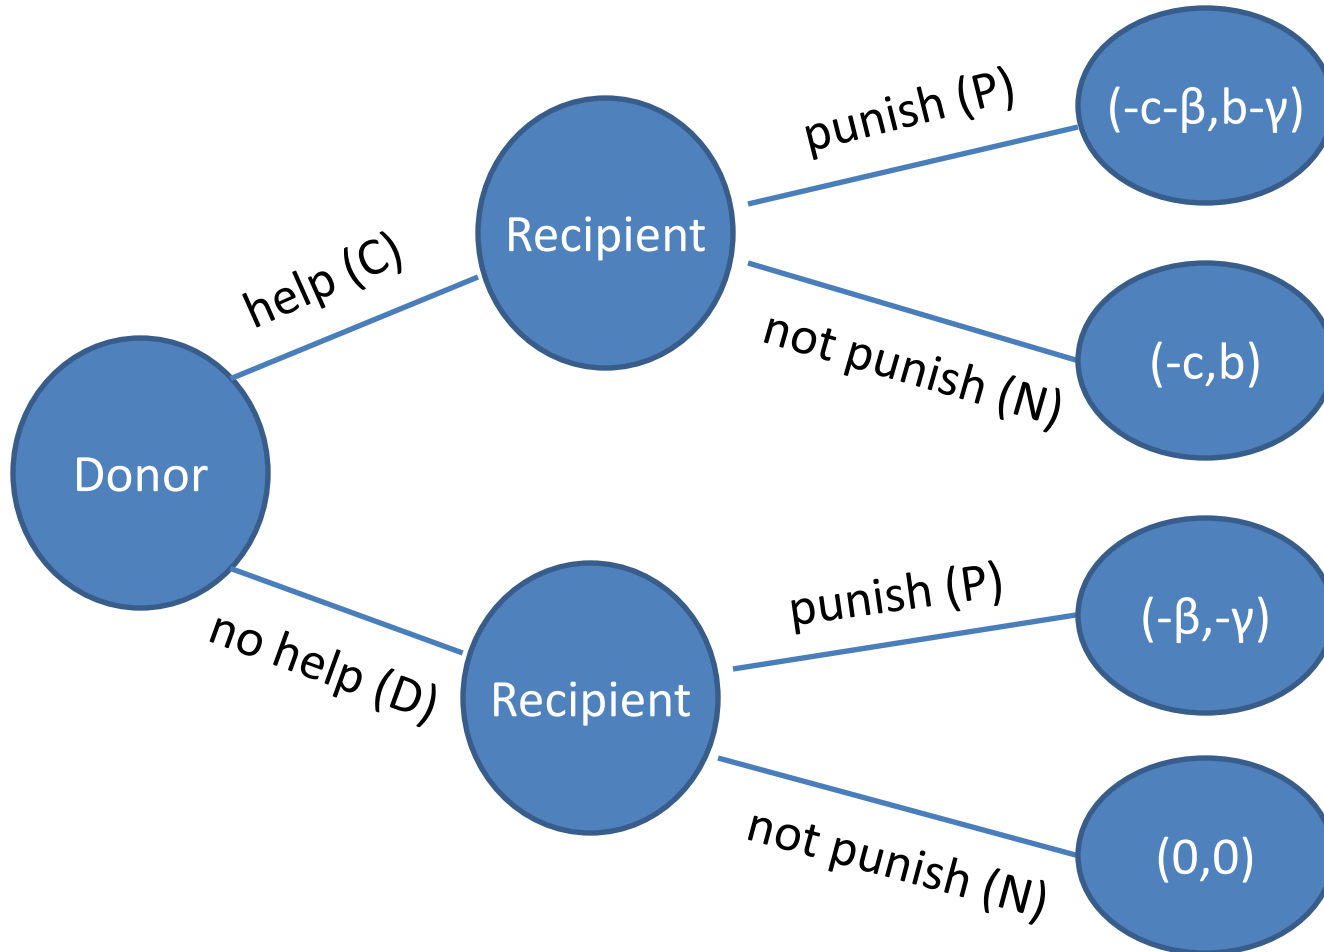

From the Carrot to the Stick

Introduction

- Helping Game with Punishment

Model & Results

Discussion

costs of helping	$-c$
benefit of help	b
punishment fine	$-\beta$
costs for the punisher	$-\gamma$

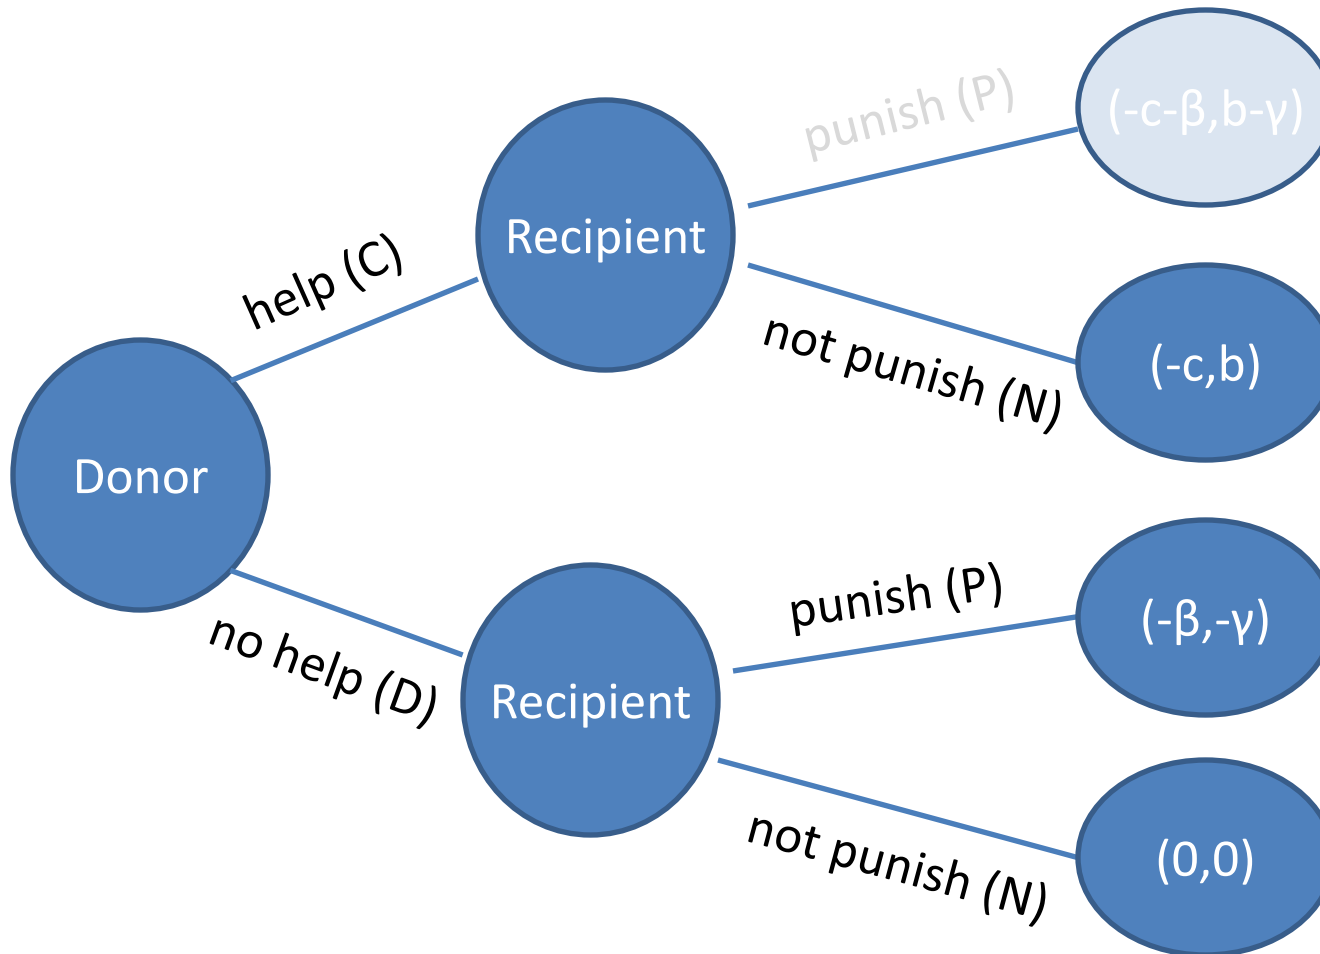

From the Carrot to the Stick

Introduction

- Helping Game with Punishment

Model & Results

Discussion

costs of helping	$-c$
benefit of help	b
punishment fine	$-\beta$
costs for the punisher	$-\gamma$

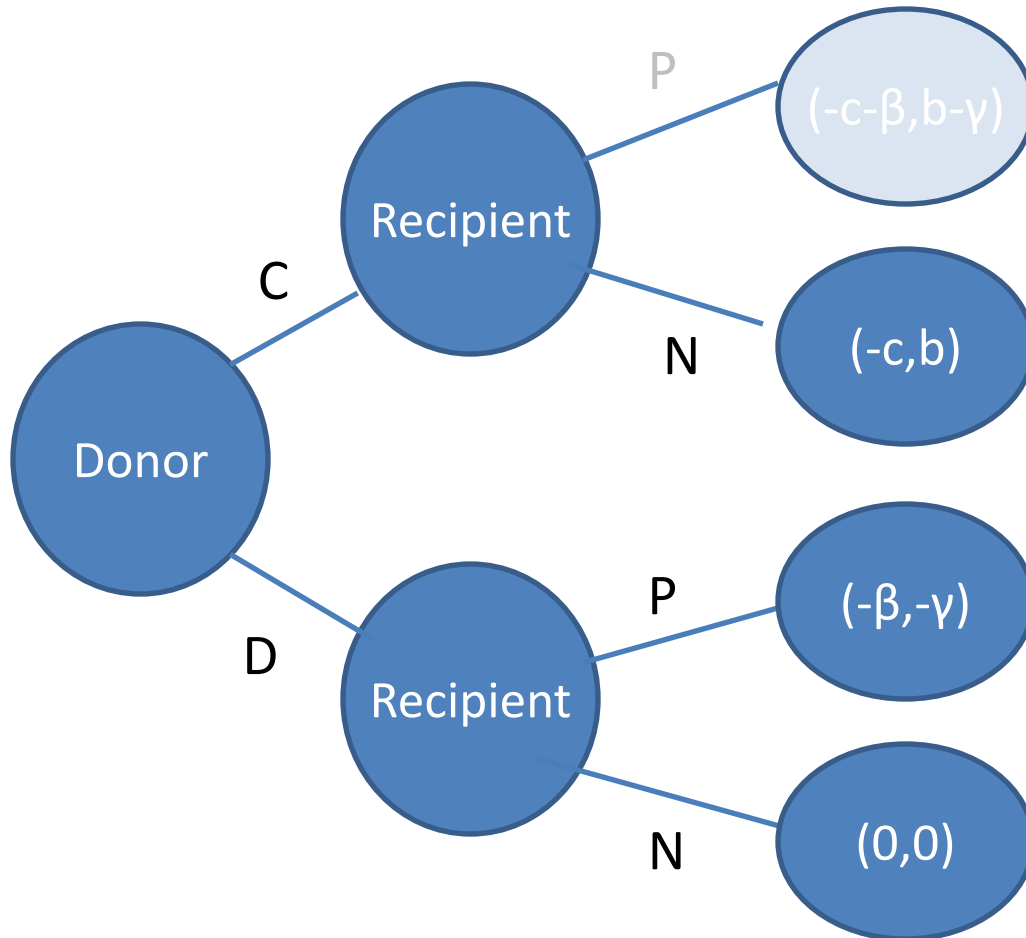

From the Carrot to the Stick

Introduction

- Helping Game with Punishment

Model & Results

Discussion

Each player has:

- 2 possible strategies for the helping game (C resp. D)
- 2 strategies for the incentive game (P resp. N)

In total 4 strategies:

- [C,N]
- [C,P]
- [D,N]
- [D,P]

Discussion

- Helping Game with Punishment

Payoffmatrix

$$\left(\begin{array}{c|cccc} & [C, N] & [C, P] & [D, N] & [D, P] \\ \hline [C, N] & b - c & b - c & -c & -c \\ [C, P] & b - c & b - c & -c - \gamma & -c - \gamma \\ [D, N] & b & b - \beta & 0 & -\beta \\ [D, P] & b & b - \beta & -\gamma & -\beta - \gamma \end{array} \right)$$

costs of helping -c

benefit of help b

punishment fine - β

costs for the punisher - γ

From the Carrot to the Stick

Introduction

- Replicator Dynamics

Model & Results

Discussion

Replicator Dynamics

$G_1=[C,P]$, $G_2=[D,P]$, $G_3=[D,N]$, $G_4=[C,N]$

x_i ... fraction of players using G_i

Assume that x_i grows proportionally to its success in the game:

$$\dot{x}_i = x_i \cdot [(Ax)_i - x \cdot Ax]$$

From the Carrot to the Stick

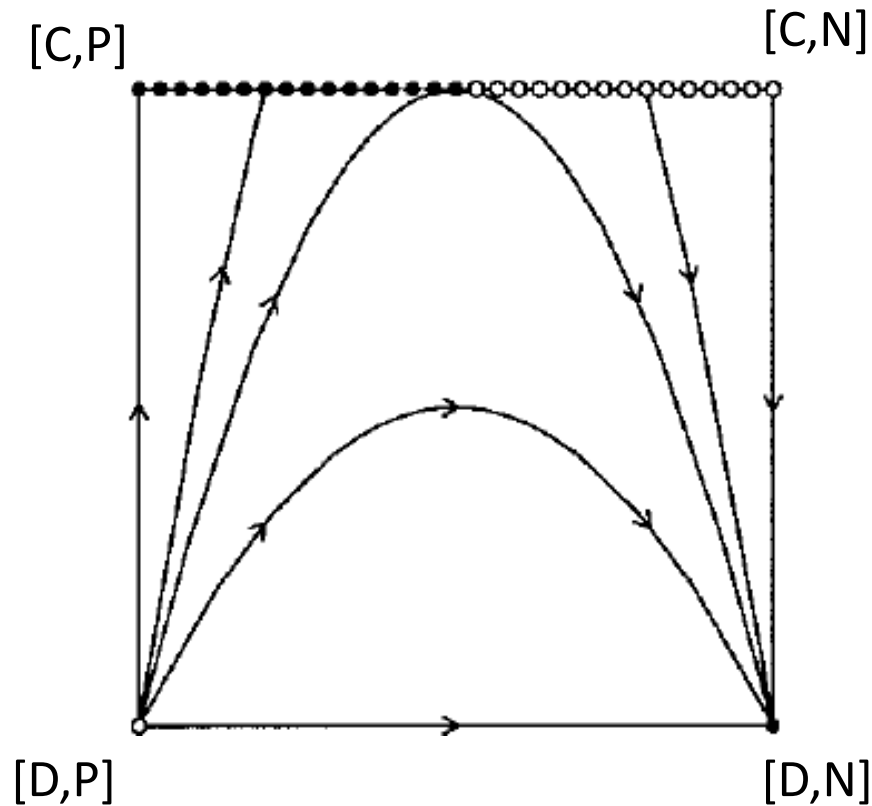

Introduction

Model & Results

Discussion

- Result: helping game with punishment

Result: helping game with punishment

- Punishment can fix cooperation, but
- Punishment itself is highly unstable

From the Carrot to the Stick

Introduction

- Solutions of the punishment dilemma

Model & Results

Discussion

Incentives for punishment:

What can prevent the breakdown of punishment?

- Everybody who does not punish selfish individuals is punished as well (2nd order punishment) – not found in experiments
- Players are more likely to cooperate against strict co-players
→ opportunism

From the Carrot to the Stick

Introduction

- opportunism

Model & Results

Discussion

2 kinds of opportunism:

- An O_c player usually cooperates. If he knows by chance that he can get away with defection (i.e. if the co-player plays N), then he defects.
- An O_D player usually defects. But if he knows that he would be punished for defection, he cooperates.

μ ... probability that a player knows the type of its co-player

From the Carrot to the Stick

Introduction

Model & Results

Discussion

- Helping Game with punishment & opportunism

Payoffmatrix

Assumptions: $c < b$, $c < \beta$. $\bar{\mu} = 1 - \mu$

	$[O_C, N]$	$[O_C, P]$	$[O_D, N]$	$[O_D, P]$
$[O_C, N]$	$\bar{\mu}(b - c)$	$\bar{\mu}b - c$	$-\bar{\mu}c$	$-c$
$[O_C, P]$	$b - \bar{\mu}c$	$b - c$	$-\bar{\mu}c - \bar{\mu}\gamma + \mu b$	$-c - \bar{\mu}\gamma + \mu b$
$[O_D, N]$	$\bar{\mu}b$	$-\mu c - \bar{\mu}\beta + \bar{\mu}b$	0	$-\bar{\mu}\beta - \mu c$
$[O_D, P]$	b	$b - \bar{\mu}\beta - \mu c$	$-\bar{\mu}\gamma + \mu b$	$\bar{\mu}(-\beta - \gamma) + \mu(b - c)$

From the Carrot to the Stick

Introduction

Model & Results

Discussion

- Helping Game with punishment & opportunism

Result: helping game with punishment

- Bistable dynamics
- Cooperation can be fixed, but does not have a chance if initially rare

From the Carrot to the Stick

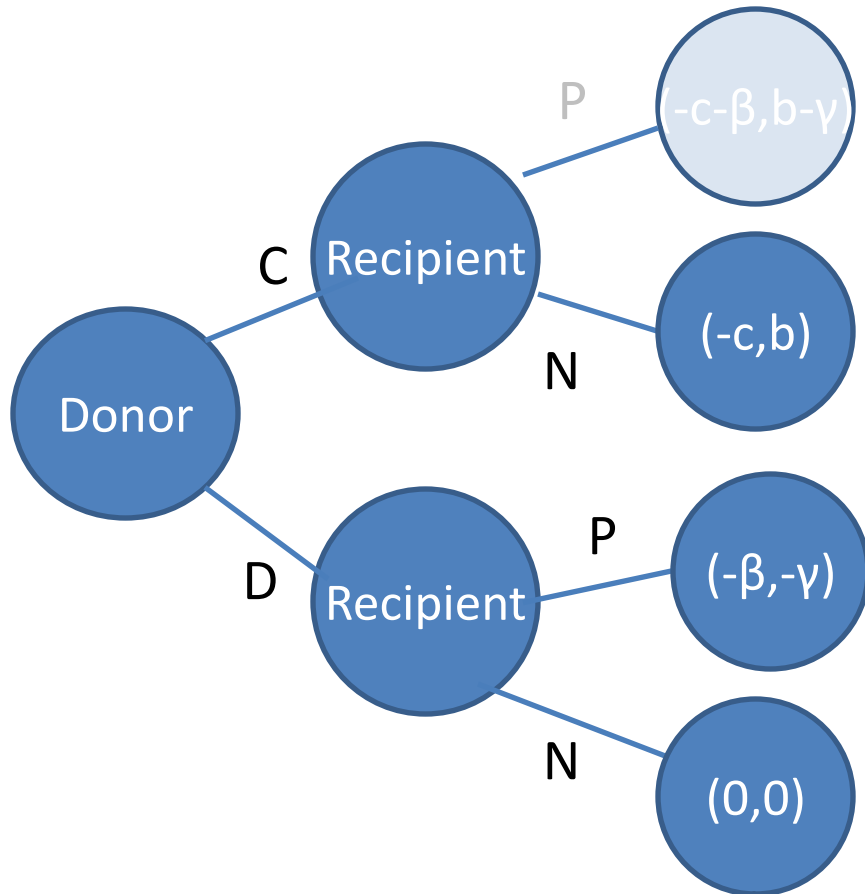

Introduction

Model & Results

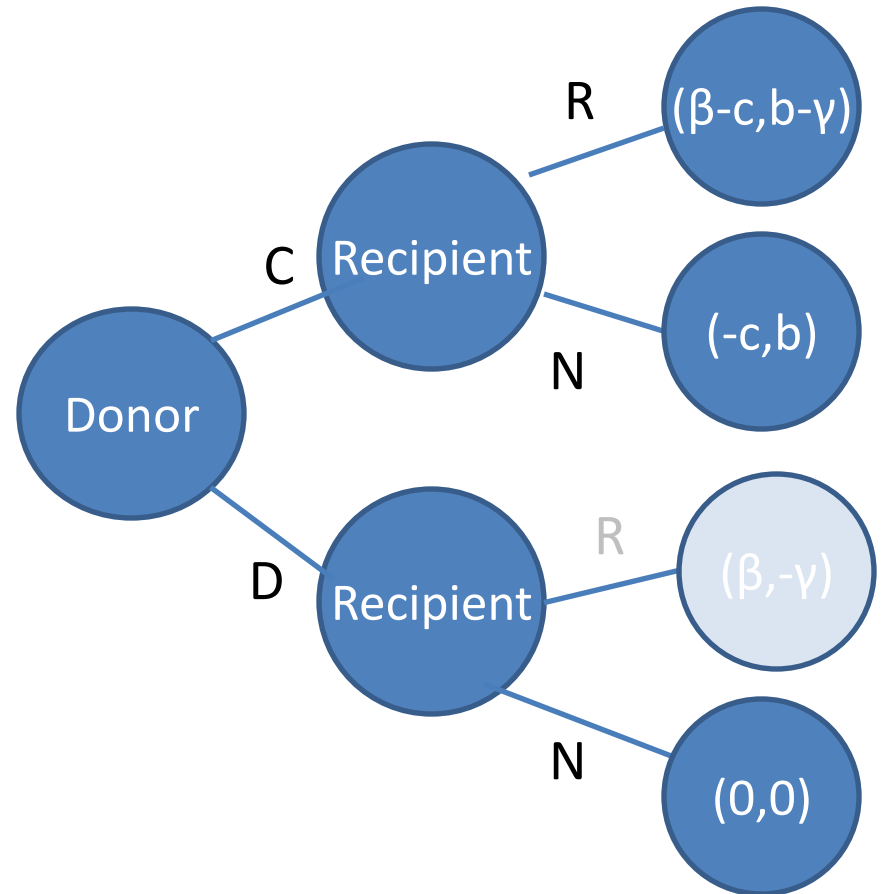

Discussion

- Reward vs. Punishment

Punishment

Reward

From the Carrot to the Stick

Introduction

- Effect of rewards

Model & Results

Discussion

Result: helping game with rewards

- Cyclic dynamics
- Neither cooperation nor defection is stable

From the Carrot to the Stick

Introduction

- Open questions

Model & Results

Discussion

Open questions:

What happens if both types of incentives, reward and punishment are available?

Is it possible to fix cooperation even if initially rare?

What is the more efficient / effective type of incentive?

From the Carrot to the Stick

Introduction

Model & Results

Discussion

- Setting of our model

Basic idea of our model:

- We directly follow these approaches
- Instead of binary options for the incentive stage (P,N or R,N), we allow all 3 strategies (P, R, N)
- For the first stage we allow 2-4 strategies (All C, All D; O_C and O_D)

From the Carrot to the Stick

Introduction

Model & Results

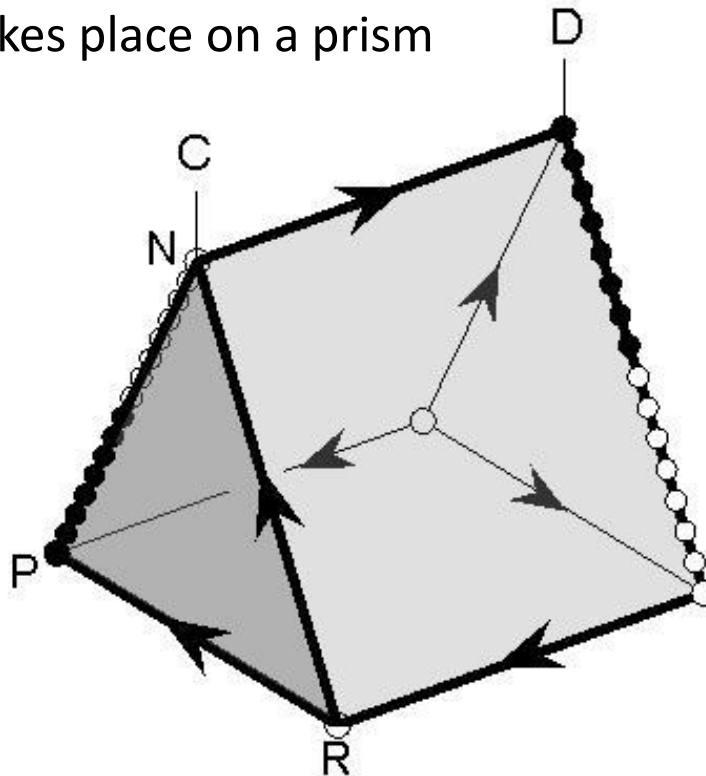

Discussion

- Games on a prism

2x3 role games on a prism:

Because of these invariants, the problem has essentially 3 dimensions.

→ dynamics takes place on a prism

$\mu = 30\%$	0.000	0.068	0.040	—	0.858	0.034
$\mu = 40\%$	0.000	0.191	0.191	—	0.381	0.238

From the Carrot to the Stick

Introduction

Model & Results

Discussion

- General conclusion

General conclusions for our model:

- Opportunism allows the evolution of cooperation
- In our model, punishment is more effective than rewards because it becomes cheaper as soon as cooperation is established
- Rewards can act as a catalyzer if the population consists of a majority of defectors

From the Carrot to the Stick

Introduction

Model & Results

Discussion

- Experimental results

Experimental Results I: Rockenbach & Milinski, Nature 444, 2006

- Individuals played a public good game with 20 rounds
- Players had the choice to play in a game with rewards only or to chose a group with allowed punishment
- Subjects preferred the group with the opportunity of costly punishment in the second half (periods 11-20)
- Contributions are highest with both, punishment and rewards

From the Carrot to the Stick

Introduction

Model & Results

Discussion

- Experimental results

Experimental Results II: Rand et al., Science 325, 2009

- Public good game with 50 rounds, always with the same 4 partners
- Four treatments: Control, PN, RN, RNP
- RNP leads to the highest contributions, but those who reward get the highest payoff
- Their conclusion: „Winners don't punish“ (Dreber et al., Nature 452, 2008)

From the Carrot to the Stick

Introduction

Model & Results

Discussion

- Experimental results

Our model vs. experiments:

- Altruistic punishment:

In experiments, subjects also punish unfair behavior even if this yields no personal monetary advantage

- Incentives for providing incentives:

In our model, players could only use incentives to enforce cooperation in the helping game. In experiments, incentives may be used to control the co-player's use of incentives, e.g. counter-punishment
