CO₂-Emissions Business as Usual (BAU) vs EU's 2°C-Target

Climate-Economists until 2006:

„2° target costs 5..20% GWP

Too expensive!!
Too dangerous!!“

Our Research Question

- **When to invest how much into what energy technology, given the 2°C target?**
- Options:
 - Renewable sources
 - Energy efficiency
 - Carbon capture & „sequestration“ (CCS)
- ⇒ **coupled economy – climate modules.**
- *Project Edenhofer/Held 2003-2007 funded by VolkswagenFoundation, then EC funded ADAM-Pr.*

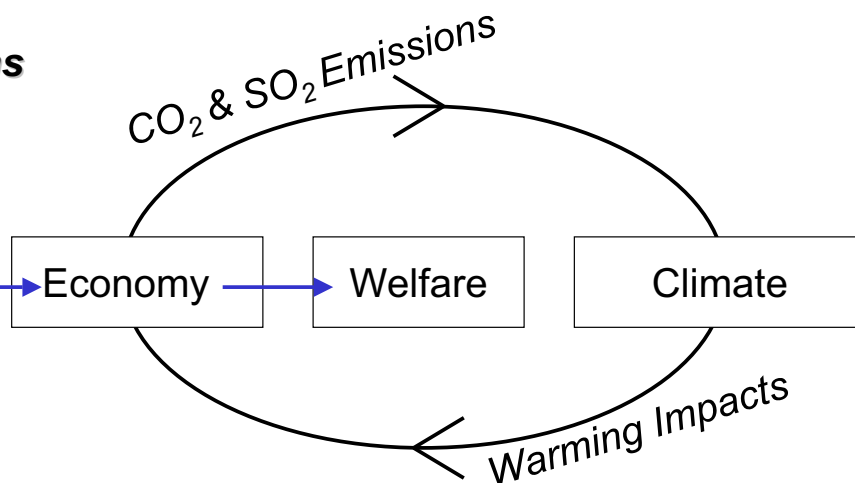

Carbon Capture & Sequestration

Standard Approach: Cost Benefit Analysis of the Climate Problem

Control Paths

- Investments in
- Renewables
 - Efficiency
 - Fossil Fuels
 - CCS

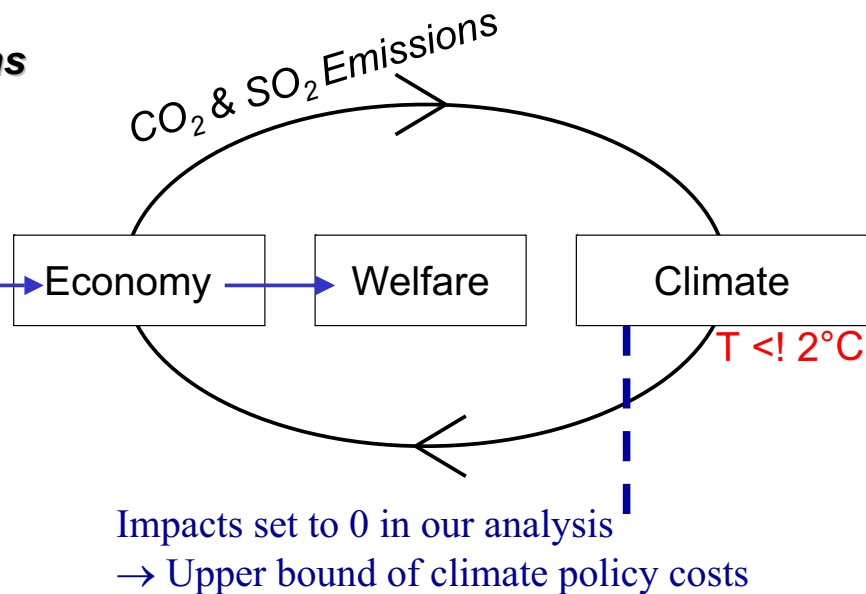

$$\text{Max ! } \int dt \text{ Utility}(t) [\text{control Paths}] \exp(-r t);$$

Our approach: Cost Effectiveness Analysis of the 2°C Target

Control Paths

Investments in

- Renewables
- Efficiency
- Fossil Fuels
- CCS

Model of Endogenous Economic Growth MIND

- Optimisation until 2300
- Discounting 1% / year
- Cost reduction due to
 - ‚learning-by-doing‘ &
 - R&D

(Edenhofer et al., Ecol. Econ. 2005)

Archetypical Economic Growth Model (after F. Ramsey)

- Increase in capital (factories, ...)

$$dK/dt = \sqrt{K} - C$$

- In each period, production \sqrt{K} may either
 - be invested in dK/dt or
 - consumed C
- Optimise time-aggr. welfare

$$\int dt \log(C(t)) \exp(-r t)$$

Costs of Fossil Resources Extraction

Economic Costs of Climate Protection

- **Stabilisation @450ppm**
≅ **0.5...1% GWP loss**
- **Induces momentum in climate policy:**
 - Environmentalists may be satisfied as the 2° target gets a chance
 - Economists are satisfied as costs are low.
- **Society can act...**
- **...in spite of ongoing normative discrepancies**

Economists claim carbon cuts won't break the world's bank

Transforming the world's energy industry to stop the flood of greenhouse gases into the atmosphere might actually be quite cheap.

Figures of tens of trillions of dollars are often cited, and used to question whether measures such as the Kyoto Protocol, which attempts to limit carbon emissions, are too expensive. But according to a suite of economic models released late last month, the costs of stabilizing carbon dioxide levels could be tiny — equivalent to setting back the growth of global GDP (gross domestic product) by less than 1% over 100 years; global GDP generally grows 2–3% each year. In some cases, the right policies for limiting carbon emissions could even create a surprising win-win situation, leading

London. "But only if we do the right things."

The models simulate a complex issue in economics: how government climate policies such as research investment or greenhouse-gas regulation can bring about technological development. It is obvious that technologies evolve, but the processes involved have been factored into economic models only since the late 1990s, in part because it is difficult to untangle how advances occur. The Innovation Modelling Comparison Project, published in a special issue of *The Energy Journal*, is a two-year effort involving eleven different models that represent the latest thinking on the problem. The results are striking. Nine of the models predict that stabilizing carbon dioxide levels at 450 parts per million, widely seen as the most

"Reducing greenhouse gases will be relatively cheap — but only if we do the right things."

Carbon Capture & Sequestration

No CCS without aggressive Warming Mitigation Policy

- 2°C target ~ 450ppm CO₂
~ 0.5..1% GWP loss
- @450ppm target: ~500 GtC for CCS
- @550ppm target: ~250 GtC for CCS
- @650ppm target: CCS marginal
- (*according to our MIND model*)

Mitigation costs (Consumption losses from CO₂ stabilization)

Pure time preference rate: 1%

Cumulative CCS 2000 - 2050

Bauer et al.

CCS Bonds as Incentive for Secure Formations

Edenhofer, Held, Bauer 2005;

Held, Edenhofer, Bauer 2006

Ocean vs. Geol. Sequestration

- Pro of OS:
 - Abundant
 - Remote
- Cons of OS
 - Less efficient
 - Unclear impacts + large spatial range (wrt natural variability)
 - Correlated risk with global warming via uncertain diffusivity parameter
 - Bonds schemes harder to design

Potential for {HH-> Workshop}

- Economically feasible low CO₂ conc paths
- Extra costs of ,strangelove ocean' (shut down of carbon pump) – ,within 2h'
- Effects of economic acidification damages on optimal CO₂ paths
- Early warning system for system thresholds

Potential for {Workshop -> HH}

- Potential for acidification thresholds?
- Holocene to present day deep sea pH fluctuations?
- Seabed leakage CO₂ observation limit?
- Assessment of Ocean mineralisation?

My Research – Further Topics

- Extra investment to insure against system response uncertainty (Held et al., subm. En. Econ.)
- Early warning systems for Tipping Points (Held&Kleinen 2004; Dakos et al.,...Held, to be resubm.)
- Expected economic value of observation systems (climate sensitivity, ...)
- Imprecise Bayesian learning & insurance for situations of deep uncertainty (Held 2007)

Summary

- GWP-loss of „2° target“ minor: ½..1%
 - due to learning by doing & R&D investments
 - assuming average climate & economic parameters
- Bond schemes for distributed environmental risk (such as CCS) promising instrument – BUT: detection limit for leakage?
- Pre-‘System Dynamics‘ Assessment of CO2 release into the ocean by reference to natural variability?
